

2021 Aerial Insect and Disease Survey

USGS 100K Quad: GRANGEVILLE - E145116; 9G

Label	Damaging Agent	Primary Host
4_OR 1 7 8	Mortality Agents F ₂ Engraver Douglas-fir Beetle Ips Engraver Beetles Western Pine Beetle	Pacific silver, grand, CA red, noble & white fir Douglas-fir ponderosa pine ponderosa pine
TM-L	Defoliators Douglas-fir Tussock Moth	Douglas-fir, grand & white fir
TM-M	Other Damaging Agents Douglas-fir Tussock Moth	Douglas-fir, grand & white fir

NOTE: Only the damage types present in this quad are listed in this legend. The cause of damage is described by an alpha numeric label, which is followed by the number of trees affected for points, or the percent affected code for polygons (1 - Very Light, 2 - Light, 3 - Moderate, 4 - Severe, 5 - Very Severe).

USGS 100K Quad: GRANGEVILLE - E145116; 9G

2021 Aerial Insect and Disease Survey

Map Scale: 1:100,000
Date: 27 December 2021

- Damage Points**
- Mortality
 - Defoliation
 - Unknown Damage
- Damage Areas**
- Mortality
 - Defoliation
 - Unknown Damage
- Legend:
- Areas Not Flown During Aerial Survey
 - 2021 Wildfires > 100 acres
 - WDRN Managed Lands

The basemap is an ESRI map service of TOPOI data (Copyright 2013 National Geographic) which is comprised of seamless, scanned images of USGS paper topographic maps. For more info on this map see http://gto.arcgis.com/maps/USA_Topo_Maps.

A data dictionary, digital copies of this map and geospatial insect and disease data are available at: <http://www.fs.usda.gov/detail/forest-grasslandhealth/insects-diseases/>

How the Aerial Surveys Are Conducted

Data represented on this map are based on trees visibly affected by forest insects and diseases detected and recorded during aerial survey flights conducted by the USDA Forest Service, the Washington Department of Natural Resources and the Oregon Department of Forestry. Observers have just a few seconds to recognize the color difference between healthy and damaged trees of different species; diagnose causal agents correctly; estimate intensity; delineate the extent of damage; and precisely record this information on a georeferenced, digital map. Air turbulence, cloud shadows, distance from aircraft, haze, smoke and observer experience can all affect the quality of the survey. These data summaries provide an estimate of conditions on the ground and may differ from estimates derived by other methods.

The aerial survey provides information on the current status for many causal agents and is important when examining insect activity trends by comparing historical and current survey data over large areas.

Overview surveys are a 'snap shot' in time and therefore may not be timed to accurately capture the true extent or severity of a particular disturbance activity. Specially designed surveys with modified flight patterns and timing may be conducted to more accurately delineate the extent and severity of a particular disturbance agent. Special surveys, such as Swiss needle cast surveys, are conducted when resources are available to address situations of sufficient economic, political or environmental importance.
