

# 2021 Aerial Insect and Disease Survey

## USGS 100K Quad: SNOQUALMIE PASS - A147121; 4D

Label	Damaging Agent	Primary Host
AB_Mort	Mortality Agents Balsam Woolly Adelgid Douglas-fir Beetle	Pacific silver, subalpine, grand & white fir
GB	Mountain Pine Beetle	Mountain pine
6L	Western Pine Beetle	lodgepole pine
8	Western Pine Beetle	ponderosa pine
BB	Bears	subalpine fir
BEAR	Unknown	Unknown
UNKD_Con	Western Balsam Bark Beetle	western hemlock
5	Unknown	Pacific silver, noble & grand fir
DC	Unknown	western hemlock
4.WA	Fir Engraver	western hemlock
DH	Unknown	western hemlock
AB-L	Balsam Woolly Adelgid	Pacific silver, subalpine, grand & white fir
UNKD_Con-L	Unknown Defoliant	Unknown conifer
Other Damaging Agents	Balsam Woolly Adelgid Douglas-fir Engraver Larch Needle Cast Hest	Pacific silver, subalpine, grand & white fir Douglas-fir western larch All tree species

**Damage Points**

- Mortality
- Defoliation
- Unknown Damage

**Damage Areas**

- Mortality
- Defoliation
- Unknown Damage

**NOTE:** Only the damage types present in this quad are listed in the legend. The type of damage is described by an alpha numeric label, which is followed by the number of trees selected for points, or the percentage selected code for polygons (1 - Very Light, 2 - Light; 3 - Moderate, 4 - Severe; 5 - Very Severe).

**USGS 100K Quad: SNOQUALMIE PASS - A147121; 4D**  
**2021 Aerial Insect and Disease Survey**  
**Map Scale: 1:100,000**  
**Date: 23 December 2021**

**How the Aerial Surveys Are Conducted**

Data represented on this map are based on trees visibly affected by forest insects and diseases detected and recorded during aerial survey flights conducted by the USDA Forest Service, the Washington Department of Natural Resources and the Oregon Department of Forestry. Observers have just a few seconds to recognize the color difference between healthy and damaged trees of different species; diagnose causal agents correctly; estimate intensity; delineate the extent of damage; and precisely record this information on a georeferenced, digital map. Air turbulence, cloud shadows, distance from aircraft, haze, smoke and observer experience can all affect the quality of the survey. These data summaries provide an estimate of conditions on the ground and may differ from estimates derived by other methods.

The aerial survey provides information on the current status for many causal agents and is important when examining insect activity trends by comparing historical and current survey data over large areas.

Overviews surveys are a 'snap shot' in time and therefore may not be timed to accurately capture the true extent or severity of a particular disturbance activity. Specially designed surveys with modified flight patterns and timing may be conducted to more accurately delineate the extent and severity of a particular disturbance agent. Special surveys, such as Swiss needle cast surveys, are conducted when resources are available to address situations of sufficient economic, political or environmental importance.

**DISCLAIMER**  
 Forest Health Protection (FHP), Washington Department of Natural Resources (WDNR) and Oregon Department of Forestry (ODF) strive to maintain an accurate Aerial Insect and Disease Survey (ADS) Dataset, but due to the nature of the survey, the survey map is not a precise map. WDNR and ODF are held responsible for missing or inaccurate data. ADS are not intended to replace more specific information. An accuracy assessment has not been done for this dataset; however, ground checks are completed in accordance with local and national guidelines: <http://www.fs.fed.us/foresthealth/quality-assurance-and-quality-control/>. USDA Forest Service, Forest Health Protection; Washington Department of Natural Resources, Wildfire Division, Forest Health; and Oregon Department of Forestry, Forest Health Management" as the source of this data.
