# Forest Health Highlights 2001

## Virginia

The Virginia Department of Forestry provides forest health protection assistance to state and private land managers within the Commonwealth. Virginia and the USDA Forest Service Forest Health Protection unit fund this program cooperatively.

#### Virginia Forest Facts

- Over **66%** of Virginia is **forested** (more than 16 million acres).
- Almost 85% of forested acreage in Virginia is privately owned.
- The **George Washington** and **Jefferson National Forests** (1.4 million acres) provide recreational and wildlife benefits as well as timber products and jobs for thousands of people.
- **Gypsy moth** defoliation started to affect Virginia's hardwood forests in 1984 and became an increasingly serious problem over the next decade. However, from 1996 to 1999 an introduced fungal disease decimated gypsy moth caterpillars and defoliation was so light that it could not be mapped. However, in 2000 the gypsy moth defoliated 71,000 acres and in 2001 it increased to 440,000 acres.
- In late 1999 southern pine beetle (SPB) infestations increased to outbreak levels in the
  southwestern mountain counties. There were over 1,600 spots in a 15 county area, in 2000 and
  the outbreak continued throughout 2001. Overall, this does not represent a large commercial
  timber loss as most of the spots are in relatively small inaccessible patches, but it does pose a
  potential fire hazard.
- Severe, **droughts** from 1998 through 2001 have contributed to increasing pine mortality from infestations of bark beetles, and to the decline of mountain hardwoods.
- Oak decline is impacting Virginia's upland hardwood forests. Casual factors are stressors such
  as tree age, drought, frost, ice and defoliation by insects, and root disease. Oak decline and
  gypsy moth defoliation often overlap and that leads to higher levels of oak mortality.
- The **hemlock woolly adelgid** was first reported in Virginia in 1950. This insect has now spread across most of the State infesting and killing eastern hemlock.
- Virginia is actively participating in a national Forest Health Monitoring program. Through a
  network of 100-forested plots and regularly scheduled surveys, the Department of Forestry
  annually collects and interprets a wide variety of data to assess forest health conditions.

### The Virginia Department of Forestry and the USDA Forest Service

In spite of the relatively good health of Virginia's forests, a variety of insects and diseases (both native and introduced), and human-caused impacts such as air pollution, continue to threaten the State's resources. To deal with this constantly changing mix of challenges, the Virginia Department of Forestry and the Forest Health Protection unit of the USDA Forest Service cooperate to prevent, detect, suppress and manage this multitude of threats. This partnership has worked for more than 30 years to maintain and improve the health of Virginia's forests.

Forest Health Protection contributions (dollars) to the Virginia Department of Forestry Cooperative Forest Health Program, cooperative pest suppression/eradication projects and the George Washington/Jefferson National Forests pest suppression projects, 1999-2002.

	1999	2000	2001	2002
Cooperative Forest Health Program	68,607	68,607	61,569	82,782
Forest Health Monitoring	62,000	62,000	81,000	60,000
Cooperative Suppression - southern pine beetle	8,000	12,000	160,000	0
Cooperative Suppression - gypsy moth suppression	110,00	103,000	383,000	450,000
Cooperative Suppression - gypsy moth eradication	0	0	0	0
Cooperative Suppression - slow-the-Spread (gypsy moth)	536,000	604,000	535,780	664,942
George Washington/Jefferson - gypsy moth suppression	0	10,000	306,000	383,000
George Washington/Jefferson - slow- the-Spread (gypsy moth)	48,500	42,000	53,500	65,000
George Washington/Jefferson - hemlock woolly adelgid	46,000	46,000	55,000	55,000
