Introduction

The purpose of this directory is to provide a list of possible vendors of tree and shrub seed for those persons involved in the regeneration and maintenance of plant communities.

The information in this directory was compiled from data furnished by the vendors who responded to a letter sent to all commercial dealers of which the Forest Service of the U.S. Department of Agriculture and the State Foresters had a record. Endorsement of a dealer or the dealer's product is not intended and must not be inferred. Any vendor who was not included in this volume should contact the address below to be included in the next revision.

Section 1. Suggested Guidelines for Purchasing Seed

- Geographic Origin of Seeds
- Seed Testing
- What Tests Should be Performed
- Where Can Seed be Tested

Geographic Origin of Seed

Most sellers of seed in this directory will, upon request, furnish data on the origin of the seed they sell. Some vendors certify seed. Seed certified in regard to geographic origin or genetic identity is defined as having used a third party to make inspection of the seed production process in order to provide verification of genetic identity. The third party in the United States is a state Crop Improvement Agency or a state Department of Agriculture. A crop improvement agency is an independent agency created by the state government to be the official agency for certifying seed within the state.

Research in this country and other countries has proved the general superiority of tree and shrub plantings made with planting stock from seed of local origin. Seed of local origin is seed from an area subject to similar climatic influence, usually within 100 miles of the planting site and differing in elevation by less than 1,000 feet in elevation.

If seed of local origin is not available, the best second choice is seed from a region having environmental factors comparable to those at the planned planting site. Such factors include length of growing season, day length, maximum and minimum growing season temperatures, and rainfall amount and distribution.

Source identified seed is labeled with yellow tags in seed certification programs. A yellow tag will tell if the seed was collected in wild stands and would be useful in identifying local sources. The tag will be attached to the seed container in a tamper-evident manner.

In some intensive forms of cultivation such as short rotation wood production, urban or ornamental plantings, or Christmas tree production, seed has been successfully moved great distances beyond local boundaries. This should, however, only be practiced after obtaining all available information on the risks and benefits of the move. Also, occasionally, in these intensive forms of cultivation higher levels of genetic selection are certified. These higher levels are essentially of two types, phenotypically selected, and proven genetic superiority. Different colored tags are used for each level of genetic selection.

Seed Testing

Seed testing refers to the testing of the purity, moisture content, weight, and viability of the seed. Knowing the values of these quality variables is very important in establishing the dollar value of seed and its suitability for different types of regeneration. The most accurate and reliable way to test the seed is to have a sample drawn from the seed lot by an independent third party who submits it for testing to a testing laboratory skilled in testing the kind of seed in question. The least reliable is to take the word of the vendor who cut a few seeds with a pocket knife to estimate the quality. An accurate testing procedure could cost \$20 to \$100 per seed lot, but the use of poor quality seed could result in partial or complete failure resulting in millions of dollars in losses. There is rarely a good excuse for not having a laboratory test seed before paying for it.

Viability can be estimated in several ways. The best procedure is to have a germination test. This test is usually more objective because you can actually see the seedlings and their characteristics. For difficult to germinate species, estimates of viability are sometimes best made with procedures that excise the embryo from the seed and germinate just the embryo (this is called an excised embryo test) or procedures that use vital stains that stain the seed in a way that allow the living tissue to be differentiated from the nonliving. The use of x-ray is a third alternative to quickly estimate viability. An x-ray test is simply a picture of the tissues that make up the seed. This test alone may not be as accurate as an excised embryo or a chemical stain.

Moisture content is very important because it so closely regulates the viability of the seed. Most temperate species of seed will live only a brief period if they are above 10% in moisture content. A few such as oaks, silver maple, and walnuts must be kept moist to preserve viability. It is important to know the characteristics of the seed you work with. The moisture content will also determine how much water you pay for and how much seed you pay for.

Purity is an estimate of the percentage by weight of the amount of pure seed in a seed lot. The maximum purity is 100. The higher the purity, the more pure seed is in the seed lot.

Seed weight is the number of seeds per pound (or per kilogram) of pure seed. The larger the seeds the fewer seeds there are per unit weight (pound or kilogram).

Pure live seed per pound is the product of purity, seed weight and viability. It tells how many potential seedlings there are in a unit weight of seed as it is offered for sale. In general, the higher this value, the higher is the seed quality.

What test should be done on the seed I buy?

As a minimum, the moisture content and the viability of the seed should be known. The viability must be known because dead or low viability seed is of little value. Even if the vendor refunds your money, you have not obtained the plants that were desired. For general nursery usage, a viability of 80% is often required as a minimum. The higher the quality standards are for seedlings, the higher must be the quality of the seed. Many more modern nursery procedures require germination of 90% or higher for efficient operation. High viability may be difficult to acquire for some species because they are mechanically fragile or deteriorate rapidly.

Where can seed be tested?

There are both private and public laboratories in the U.S. that can test tree and shrub seed. It is good to know the qualifications of the laboratory to conduct tests. For instance, is the laboratory a member of the Association of Official Seed Analysts? Is the laboratory familiar with the species to be tested? What other training might the analyst have? The vendor should know the location of a good laboratory. If the vendor does not know, then you can contact your state's forestry agency or the National Tree Seed Laboratory at the address given in the introduction.

Section 2. Contacting a Specific Seed Vendor.

The list in this section provides the information needed to contact seed vendors by mail service, telephone or fax. The vendors are listed alphabetically. The number to the left of the vendor's name is the reference number used in Section 3, Vendor Services and Section 4, the Species Master List.

The information provided here was accurate at the time of printing. You may contact the National Tree Seed Laboratory at the address given in the introduction to receive new information, or to provide updated or additional information. Changes may occur. You may contact the National Tree Seed Laboratory at the address given in the introduction. The NTS defense may have received new information, or you may assist us in updating our list. Information is always welcome about changes to this list or about vendors not included.

Section 3. Vendor Services.

Vendors included in this directory were asked to answer the following questions. Their answers are listed on the following three pages.

- o Does your company have a catalog?
- o Can you supply source information on the seed?
- o Can you formally certify the seed source?
- o Do you maintain an inventory of seed?
- o Can you supply seed test data on your seed?
 - o Were tests performed in accordance with Association of Official Seed Analysts Rules for Testing Seeds?
- o Do you make special collections?
- o Do you have a minimum order?
 - o What is your minimum order?

Section 4. Species Master List with Company Numbers.

There are over 2000 species of tree and shrub seed offered for sale in the United States. Both native and exotic species are listed. They are listed alphabetically by scientific name. The common name is given to the right of the scientific name. If you do not know a species scientific name, consult Section 5, the Index of Common Plant Names. The numbers below the species name are the company numbers listed on the left of the company names in Section 2.

This list is a guide. It is designed to allow the seed buyer to quickly determine which vendor(s) sell seed of each species. When a vendor(s) number appears below the species name, that company has stated that they can supply that species. The buyer should be aware however that seed crops vary from year to year. In certain years a species may have a poor seed crop due to environmental conditions. A species genetics can also influence its seed crop. For these reasons some of the dealers listed below a species may not be able to provide seed of that species every year. The seed buyer should plan to contact seed vendors well in advance of the time they want to plant any seed.

In addition, many of the companies in this directory sell species of herbaceous plants (wildflowers, grasses) that are not listed in this directory.
