

# **Water Quality Monitoring in the Clearwater Basin: Continuing Citizen Science**

Supplemental Project Agreement 16-PA-11011600-040  
Contract Completion Report for 2018 and 2019 Field Years

November 2020

Joann Wallenburn, Emily McGuirt, Bruce Rieman Clearwater Resource Council

## **Introduction**

In 2013 and 2016 the Clearwater Resource Council in collaboration with the Southwest Crown Collaborative, local schools, volunteers, and neighboring organizations conducted extensive sampling to describe turbidity, Total Suspended Solids (TSS) and nutrient concentrations (Total Nitrogen and Phosphorous) in Clearwater Basin streams (Rieman and Wallenburn 2014, Rieman and Wallenburn 2015, Rieman and Wallenburn 2017). In 2016 sampling extended across the basin including most of the major tributaries to the larger valley bottom lakes. Turbidity, TSS, total N, and total P were sampled in 15 streams throughout the spring runoff. Turbidity was sampled in an additional 13 streams over the same period. Results indicated that water quality varied substantially within and among streams across the basin and that continued work would be useful to resolve important nutrient sources potentially influencing the lakes, refine monitoring techniques and build a foundation to understand long-term change.

Sampling in 2017 replicated 15 streams sampled in 2016 and added five more streams where turbidities in 2016 indicated that water quality could be of concern or where nutrient samples had not been collected in the past because of limited funding, logistical constraints or oversight. The 2017 samples represented the most complete look at water quality across the major tributary streams of the Clearwater Basin above Salmon Lake to date (Rieman, Mitchell and Wallenburn 2018). Samples were collected weekly from mid March through June 2017, a period typically encompassing more than 80% of total discharge in the basin.

Further synoptic work was not planned after 2017. However, in late summer 2017 two large wildfires, the Liberty Fire (>28,000 acres) and the Rice Ridge Fire (~160,000 acres), burned across parts of the Clearwater Basin. At least five streams experienced moderate or severe fire in a substantial portion their watersheds. It was generally agreed that continued monitoring of burned and unburned streams would be valuable. Sampling continued in 2018 and 2019, until funds were exhausted.

Sample sites are shown in Figure 1 and described in Appendix A. All 2018 and 2019 raw data are available in Appendix B. As the purpose of this continued monitoring was solely to generate a post-fire dataset to accompany the pre-fire data, no discussion, conclusions or recommendations are presented at this time.

Detailed monitoring of stream flow, water quality and estimates of annual nutrient loading in Morrell Creek through the Seeley-Swan High School's Students-In-Action Project also continued in 2018 and 2019, and will be summarized in a separate report.

## 2018 Figures

Figure 1. Sample Sites for 2018. Note that Summit Creek on the map should be Bertha and is identified as BER in the data set and Appendix A.

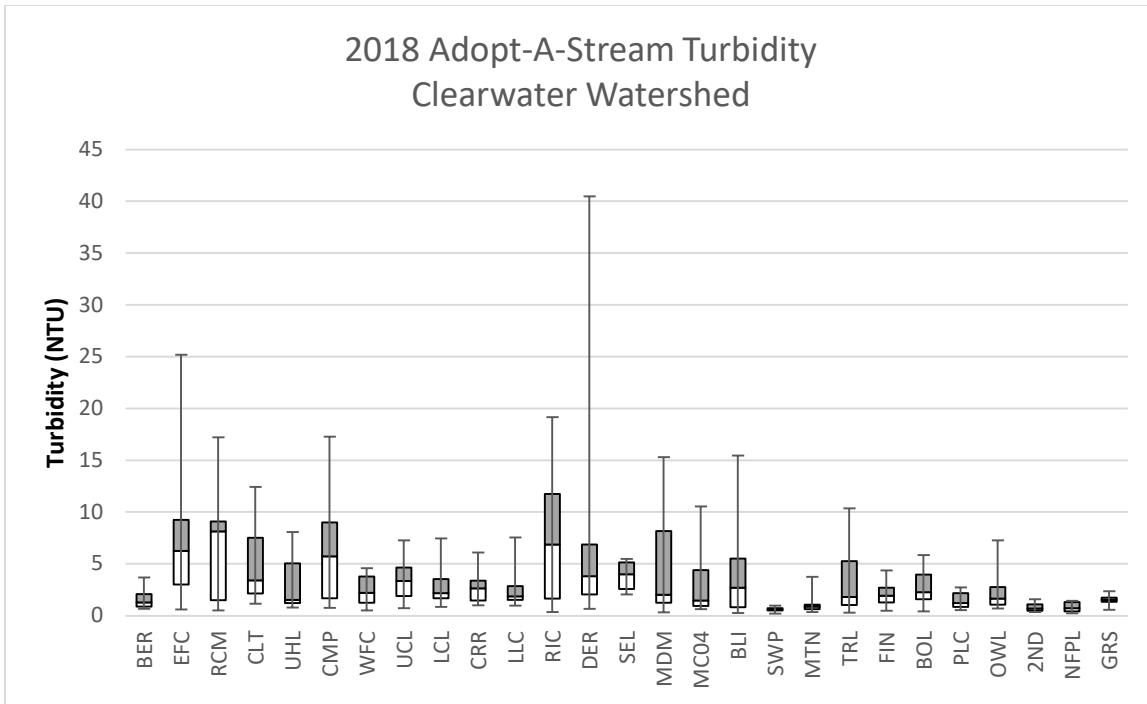

Figure 2. Turbidity in 27 sites in the Clearwater Basin, mid-March through June 2018. The vertical lines show the range of samples. The tops/bottoms of the bars show the 25th, 50th (median), and 75th quartiles. The codes for stream names are in Appendix A.

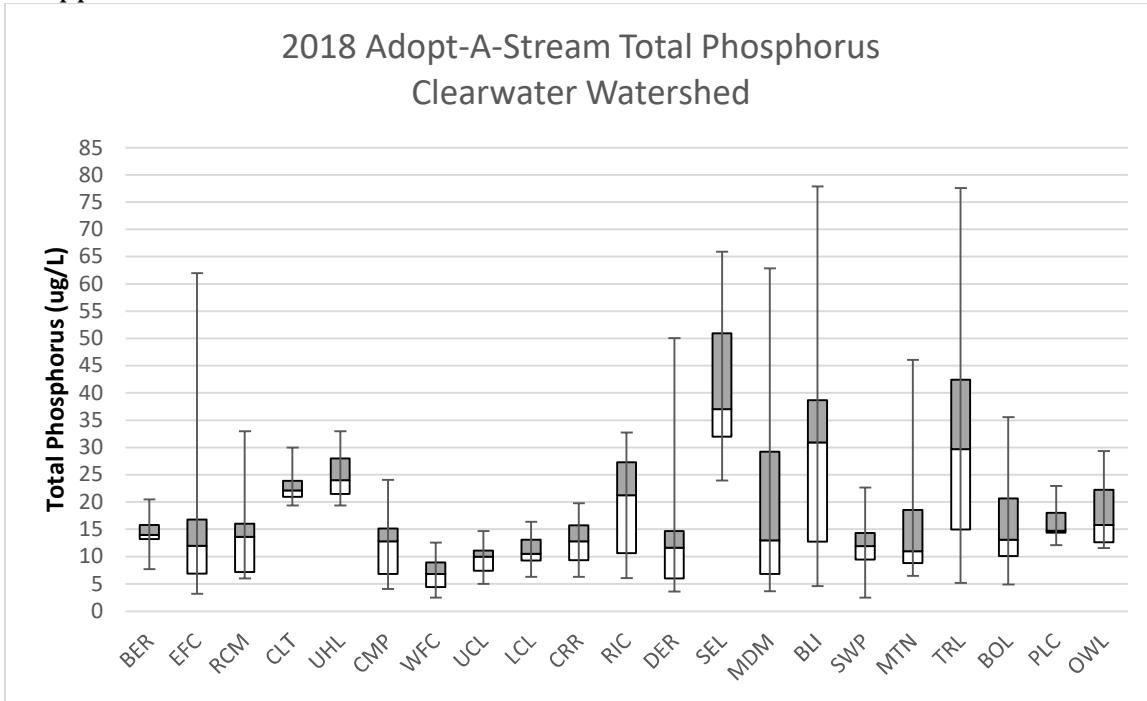

Figure 3. Total phosphorous in 21 sites in the Clearwater Basin, March through June 2018. The vertical lines show the range of samples. The tops/bottoms of the bars show the 25th, 50th (median), and 75th quartiles. The codes for stream names are in Appendix A.

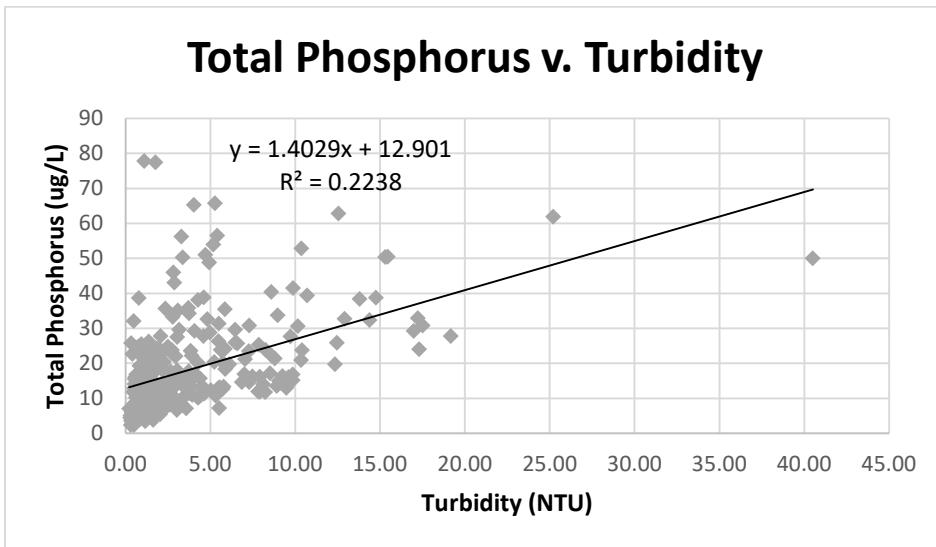

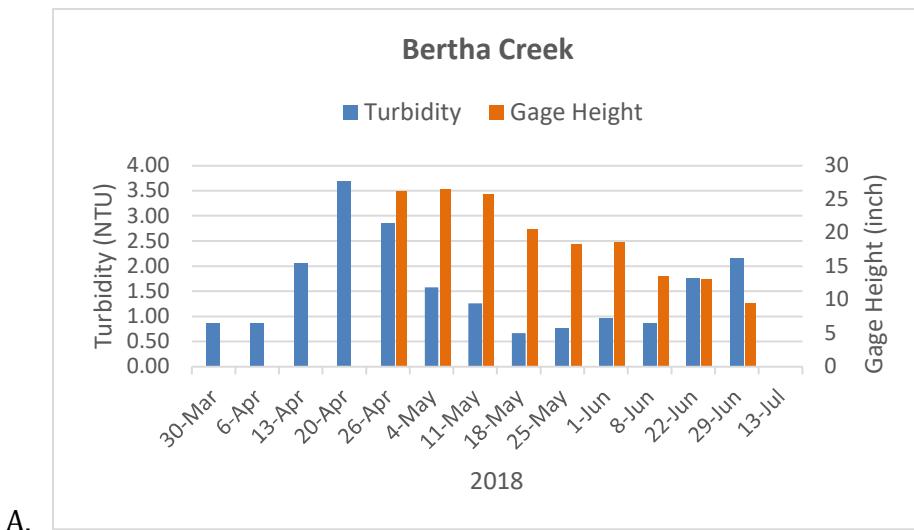

Figure 4. Associations of total phosphorous with turbidity across all sites sampled in the Clearwater Basin during runoff in 2018.

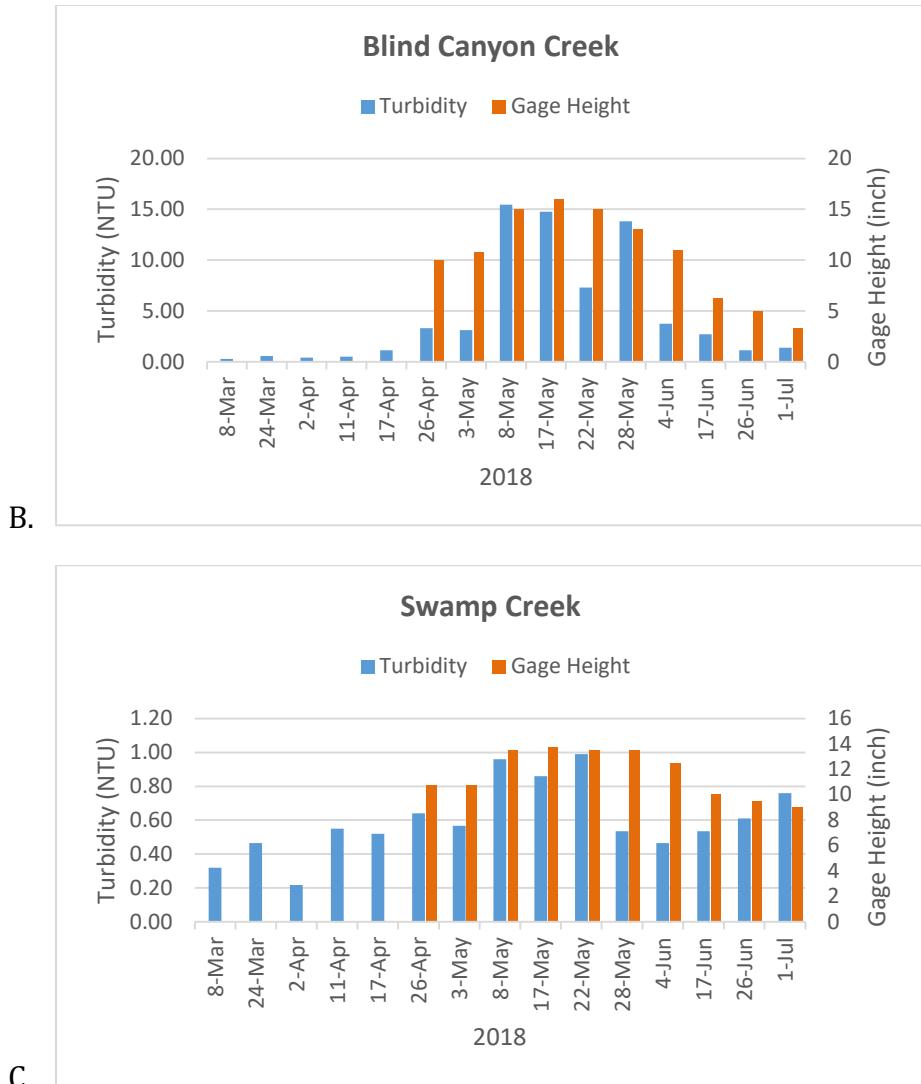

Figure 5. Associations of total phosphorous with turbidity in three sites (A=BER, B=BLI, C=SWP) sampled in the Clearwater Basin during runoff in 2018.

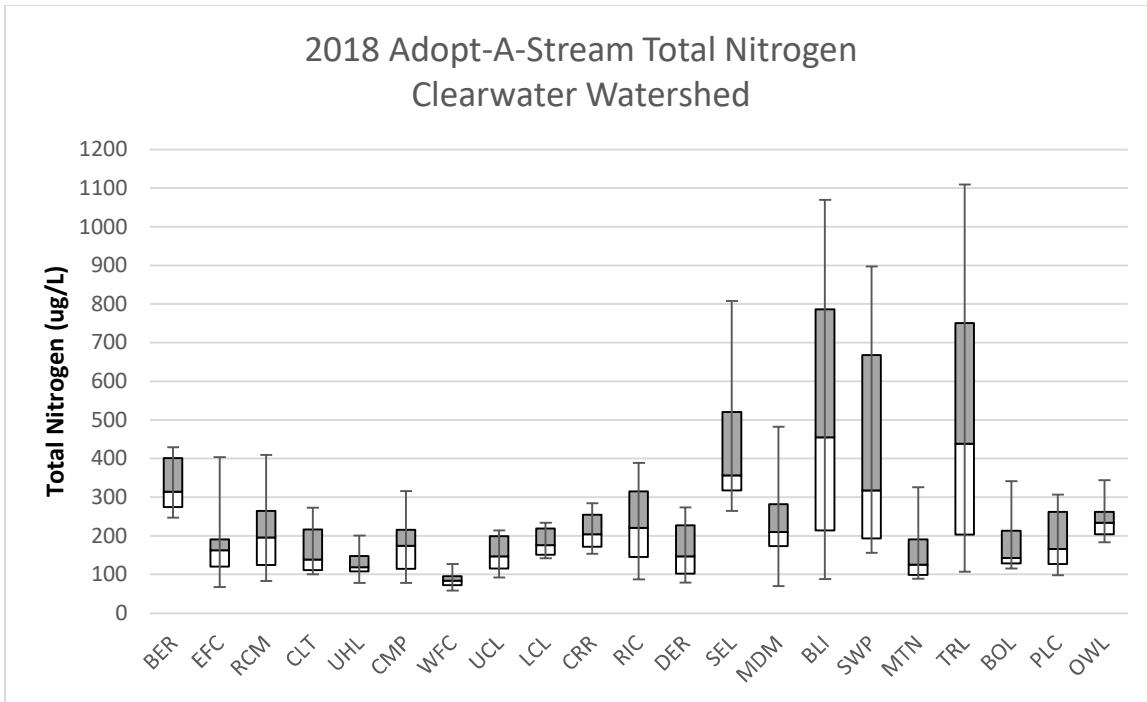

Figure 6. Total nitrogen in 21 sites in the Clearwater Basin, March through June 2018. The vertical lines show the range of samples. The tops/bottoms of the bars show the 25th, 50th (median), and 75th quartiles. The codes for stream names are in Appendix A.

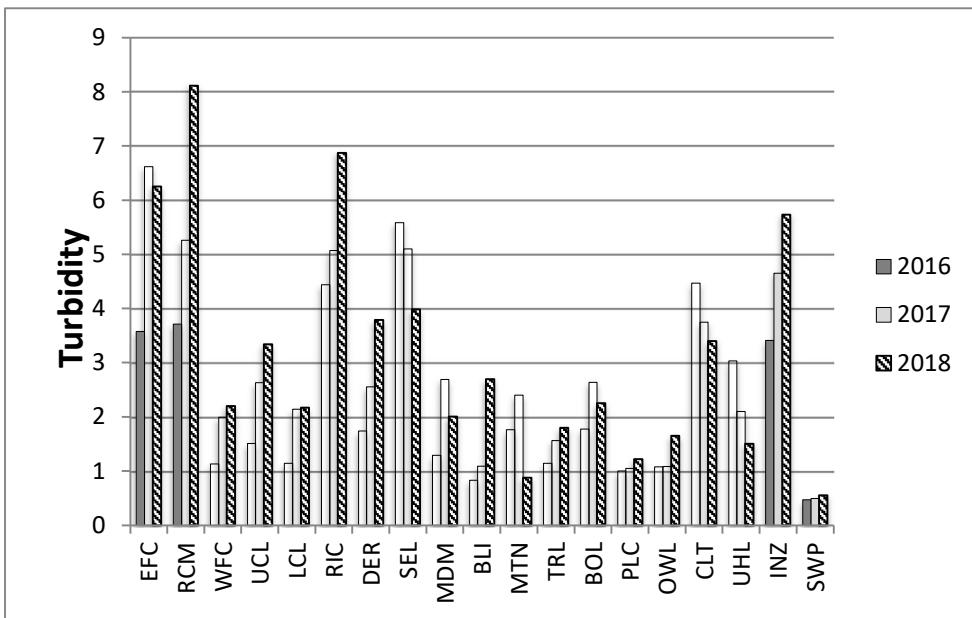

Figure 7. Median turbidity in 19 sites in the Clearwater Basin sampled from mid March through June in 2016, 2017, and 2018.

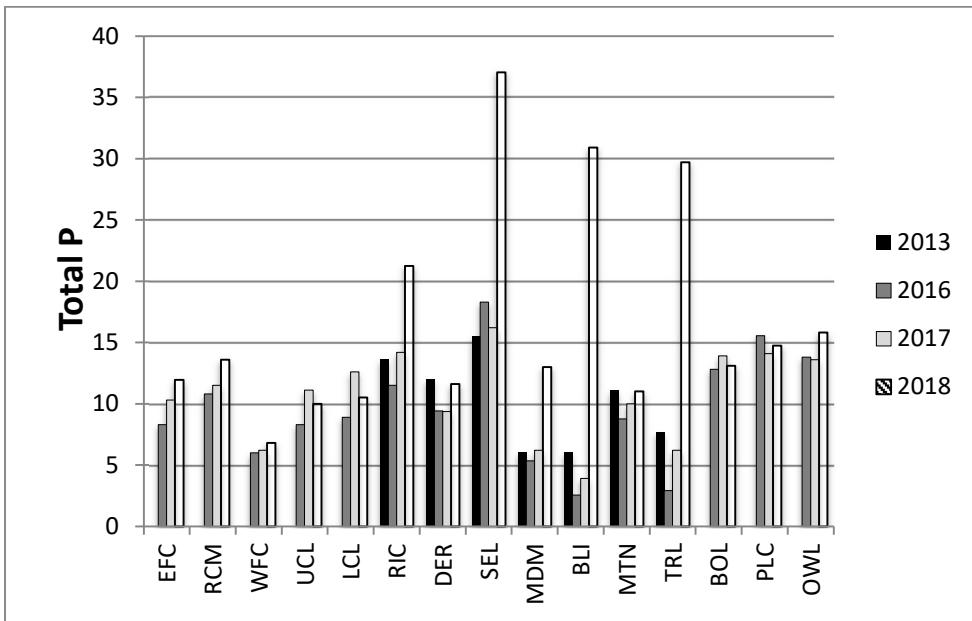

Figure 8. Median total P in 15 sites in the Clearwater Basin sampled from mid March through June in 2016 and 2017 and 7 sites sampled in 2013, 2016, 2017, and 2018.

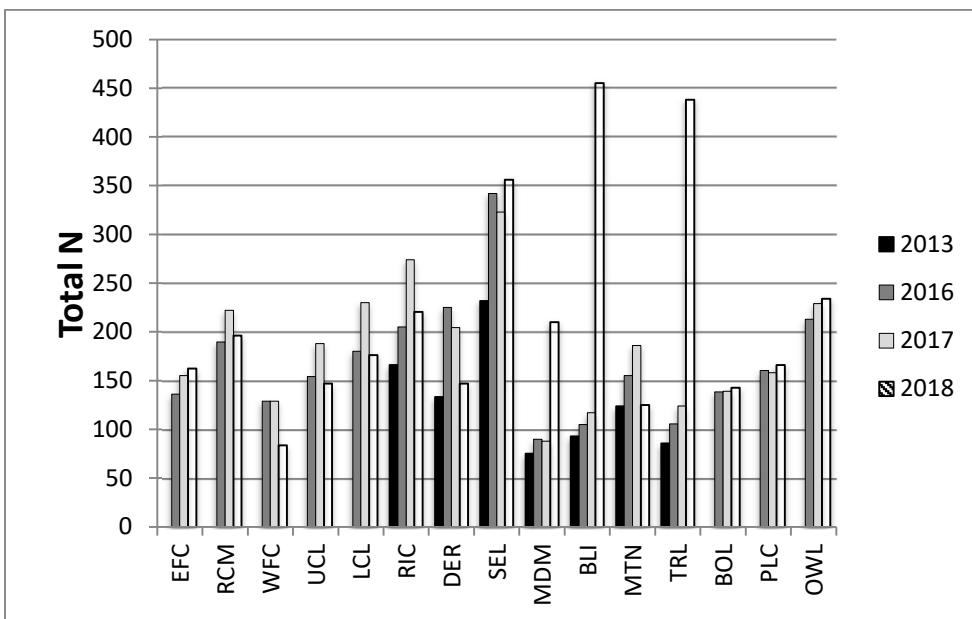

Figure 9. Median total N in 15 sites in the Clearwater Basin sampled from mid March through June in 2016 and 2017 and 7 sites sampled in 2013, 2016, 2017, and 2018.

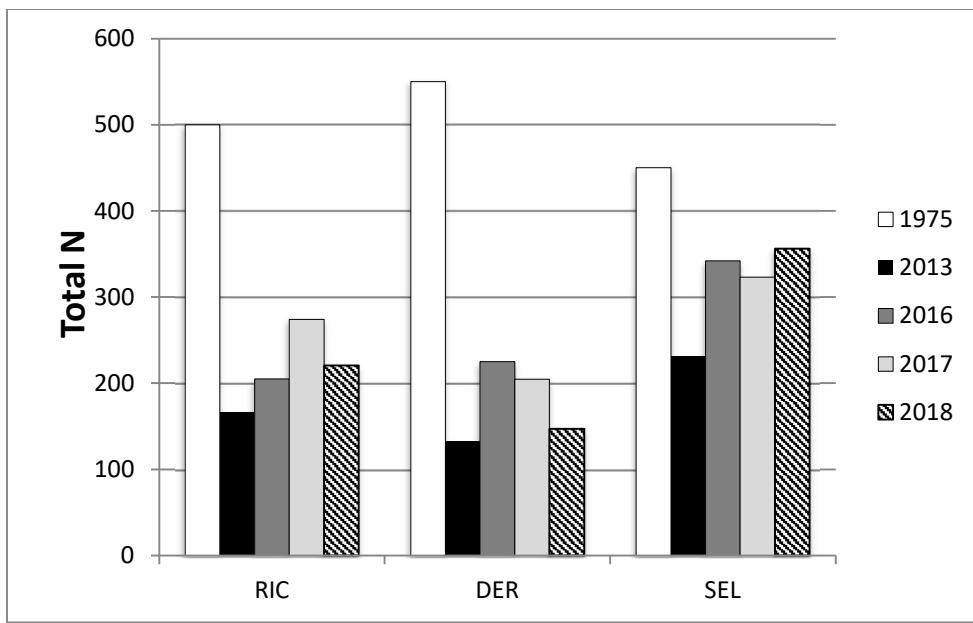

Figure 10. Median total N in three streams (RIC, DER, SEL) sampled in 1975, 2013, 2016, 2017, and 2018.

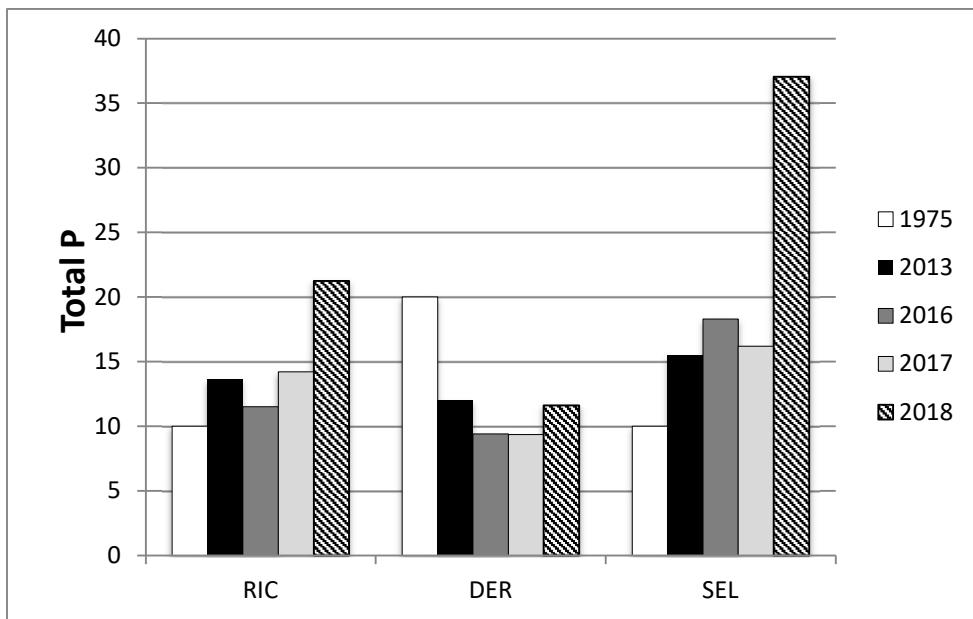

Figure 11. Median total P in three streams (RIC, DER, SEL) sampled in 1975, 2013, 2016, 2017, and 2018.

## Appendices 2018

Appendix A (2018). Sampling sites for Clearwater Basin water quality in 2018. Tier 1 streams were also sampled in 2013. Tier 1, tier 2 and tier 3 streams were sampled weekly throughout the runoff and included stage, turbidity, total nitrogen and total phosphorus. Tier 4 streams were sampled only for turbidity; and some were sampled only occasionally.

**Appendix B 2018.** Clearwater Valley Water Quality Data collected in 2018. Gage represents water depth either on a temporary staff installed at the sampling site or on a permanent gage. Negative values represent water levels that fell below the bottom of the gage and were measured from that point with a hand held ruler.

## 2019 Figures

Figure 1. Sample Sites for 2019. Note that Summit Creek on the map should be Bertha and is identified as BER in the data set and Appendix A, as well as Inez Creek should be Camp Creek and is identified as CMP in the data set and Appendix A.

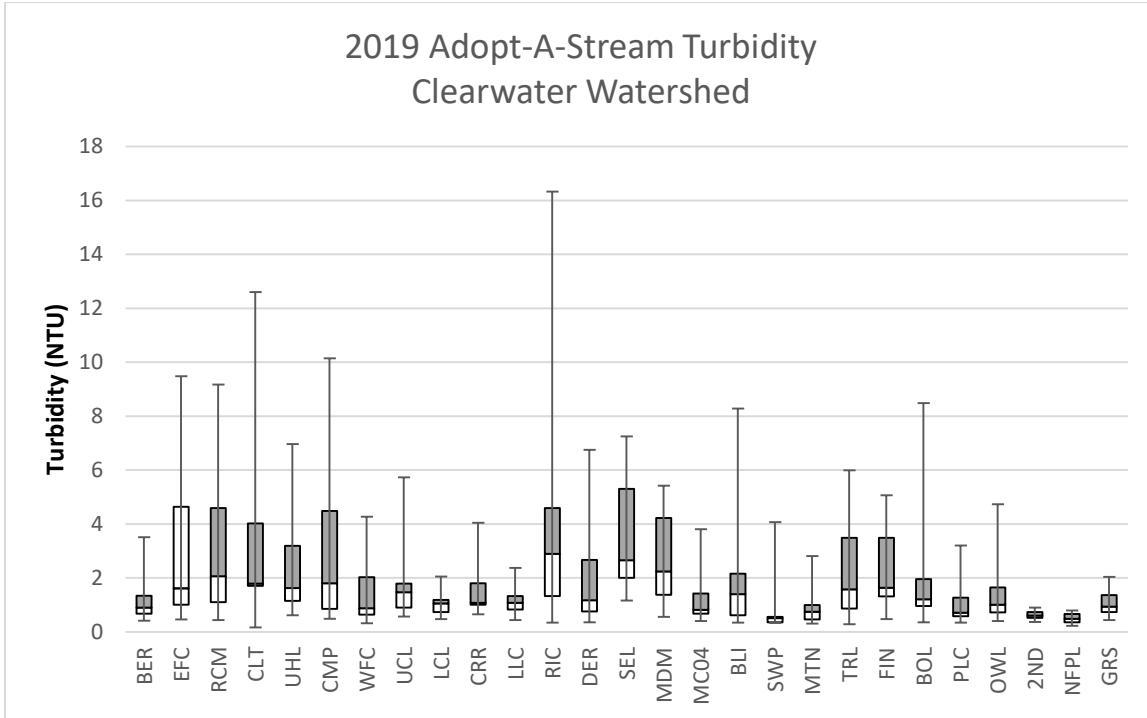

Figure 2. Turbidity in 27 sites in the Clearwater Basin, mid-March through June 2019. The vertical lines show the range of samples. The tops/bottoms of the bars show the 25th, 50th (median), and 75th quartiles. The codes for stream names are in Appendix A.

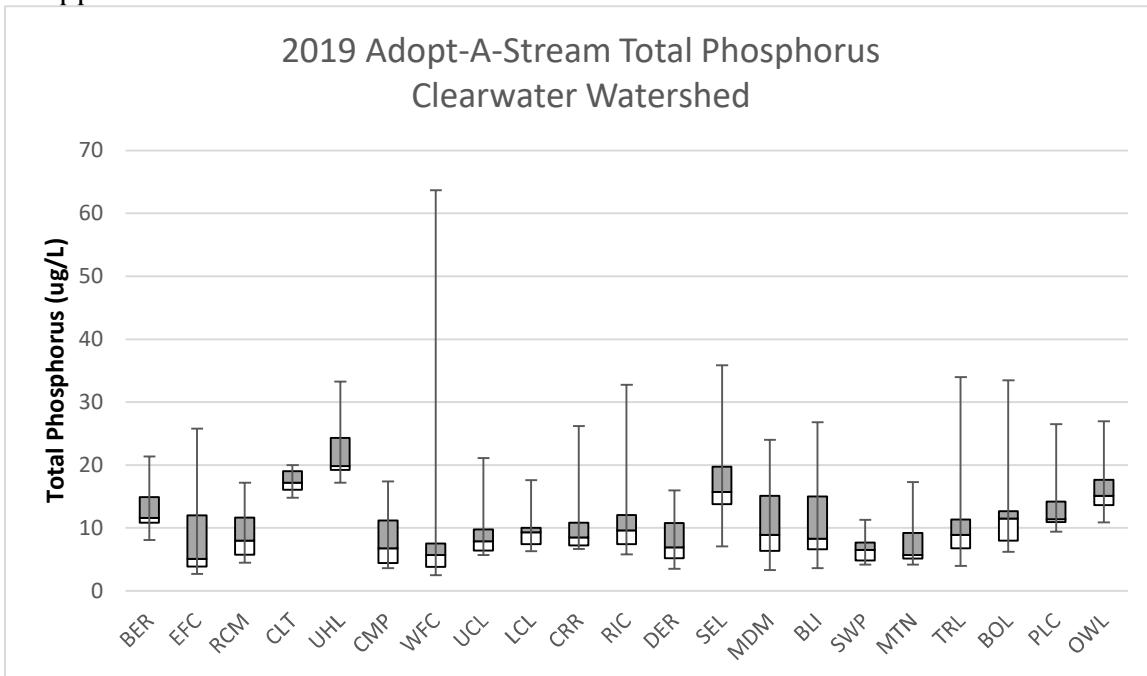

Figure 3. Total phosphorous in 21 sites in the Clearwater Basin, March through June 2019. The vertical lines show the range of samples. The tops/bottoms of the bars show the 25th, 50th (median), and 75th quartiles. The codes for stream names are in Appendix A.

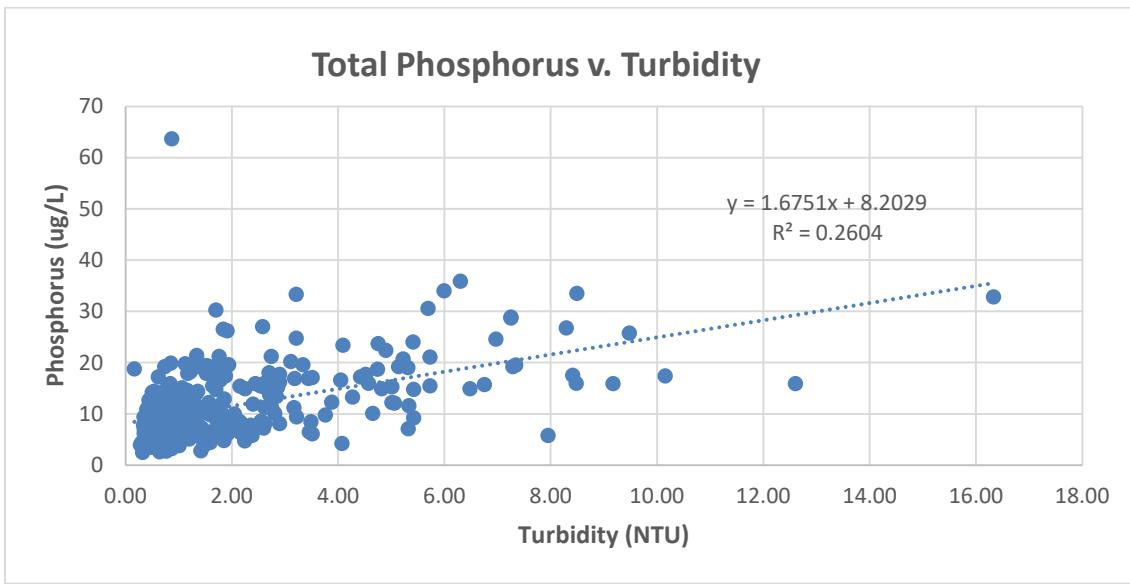

Figure 4. Associations of total phosphorous with turbidity across all sites sampled in the Clearwater Basin during runoff in 2019.

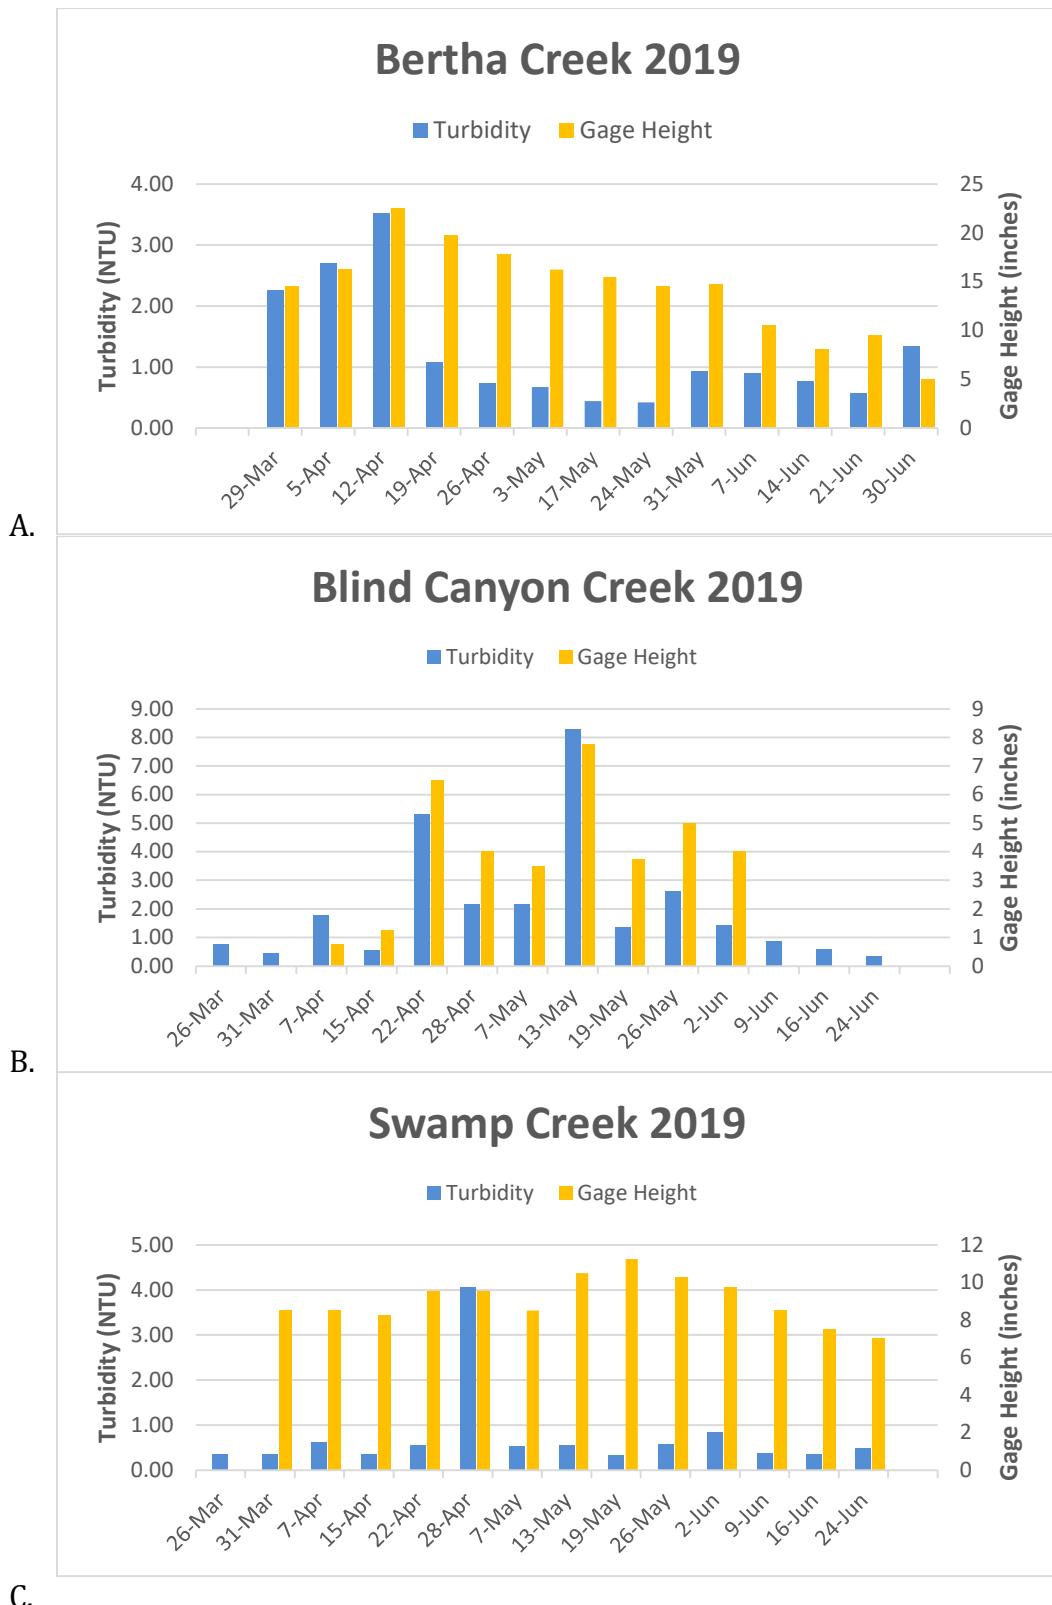

Figure 5. Associations of total phosphorous with turbidity in three sites (A=BER, B=BLI, C=SWP) sampled in the Clearwater Basin during runoff in 2018.

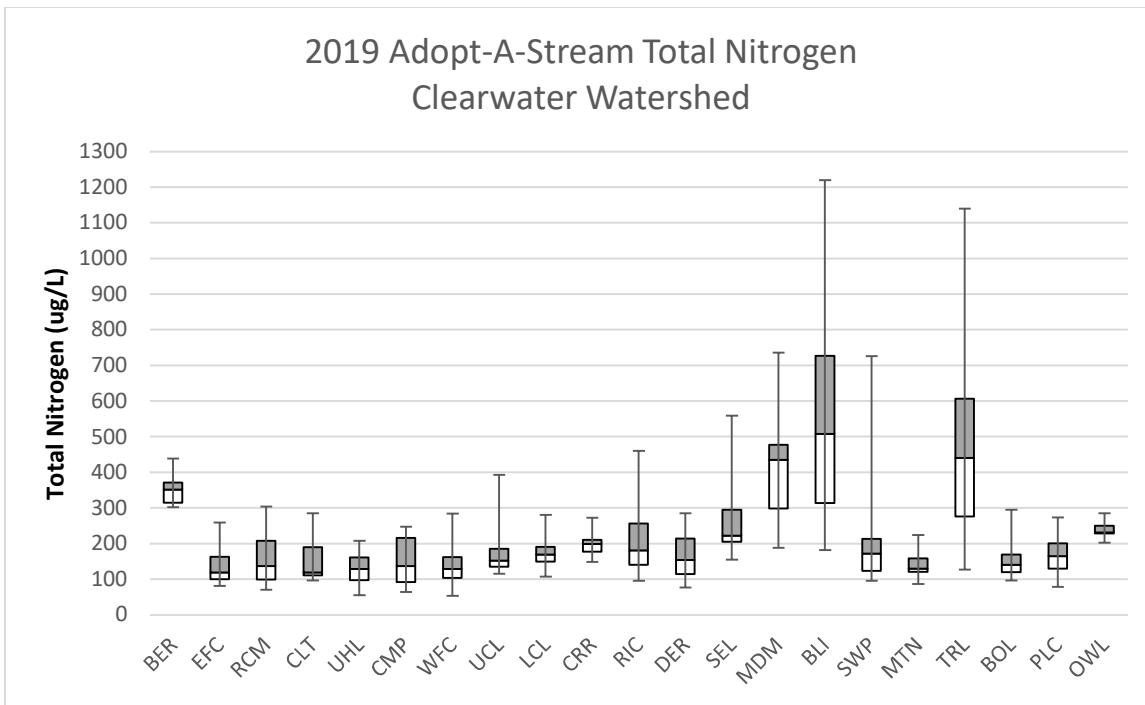

Figure 6. Total nitrogen in 21 sites in the Clearwater Basin, March through June 2019. The vertical lines show the range of samples. The tops/bottoms of the bars show the 25th, 50th (median), and 75th quartiles. The codes for stream names are in Appendix A.

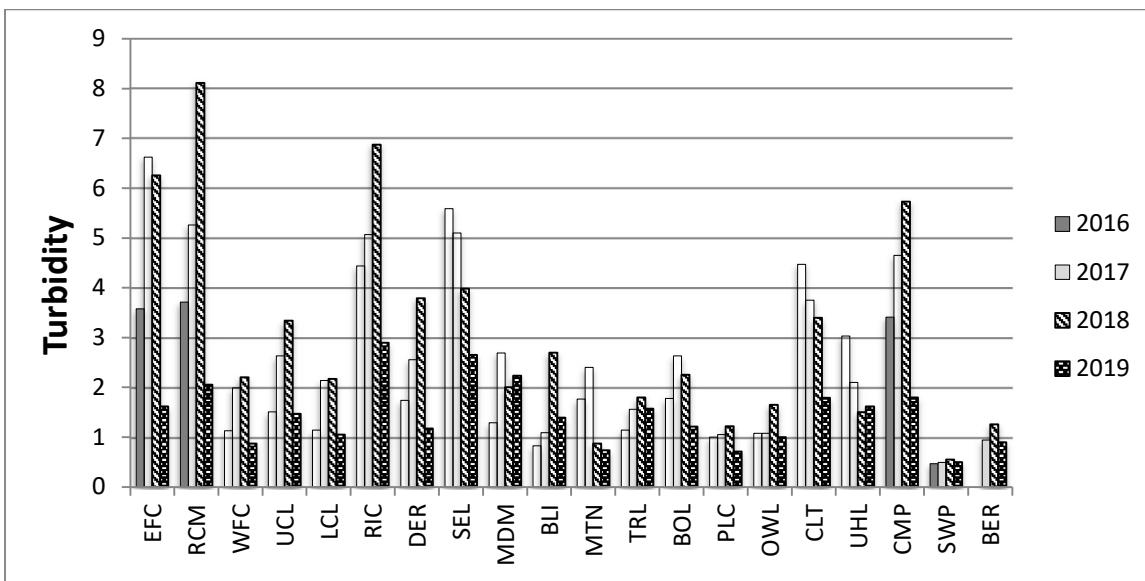

Figure 7. Median turbidity in 20 sites in the Clearwater Basin sampled from mid March through June in 2016, 2017, 2018, and 2019. Bertha (BER) was not sampled in 2016.

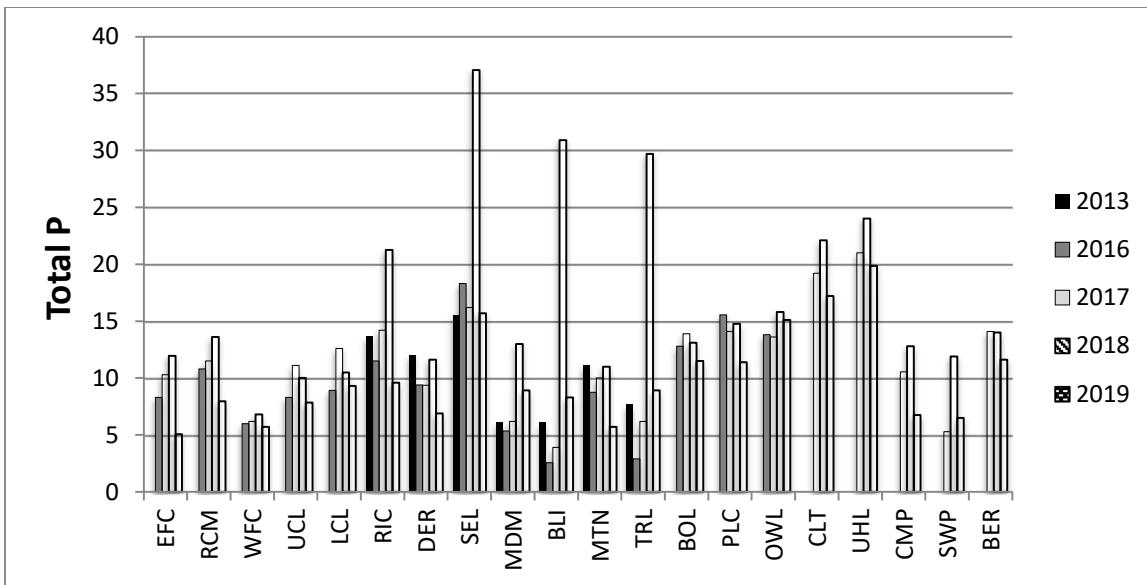

Figure 8. Median total P in 20 sites in the Clearwater Basin sampled from mid March through June in 2016, 2017, 2018 and 2019, including 7 sites also sampled in 2013. CLT, UHL, CMP, SWP, and BER were not sampled in 2016.

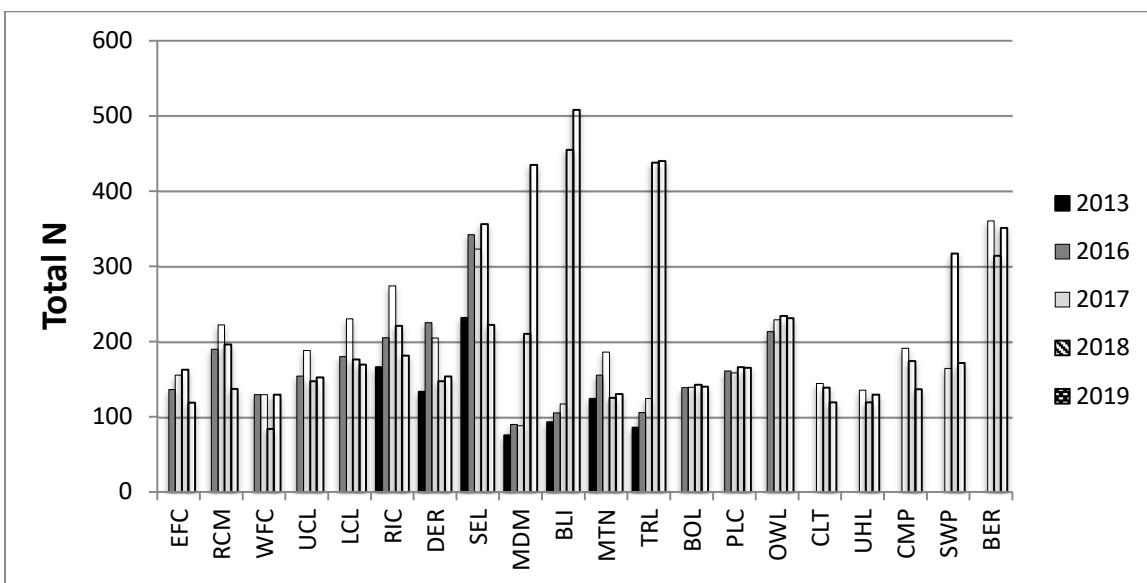

Figure 9. Median total N in 20 sites in the Clearwater Basin sampled from mid March through June in 2016, 2017, 2018 and 2019, including 7 sites also sampled in 2013. CLT, UHL, CMP, SWP, and BER were not sampled in 2016.

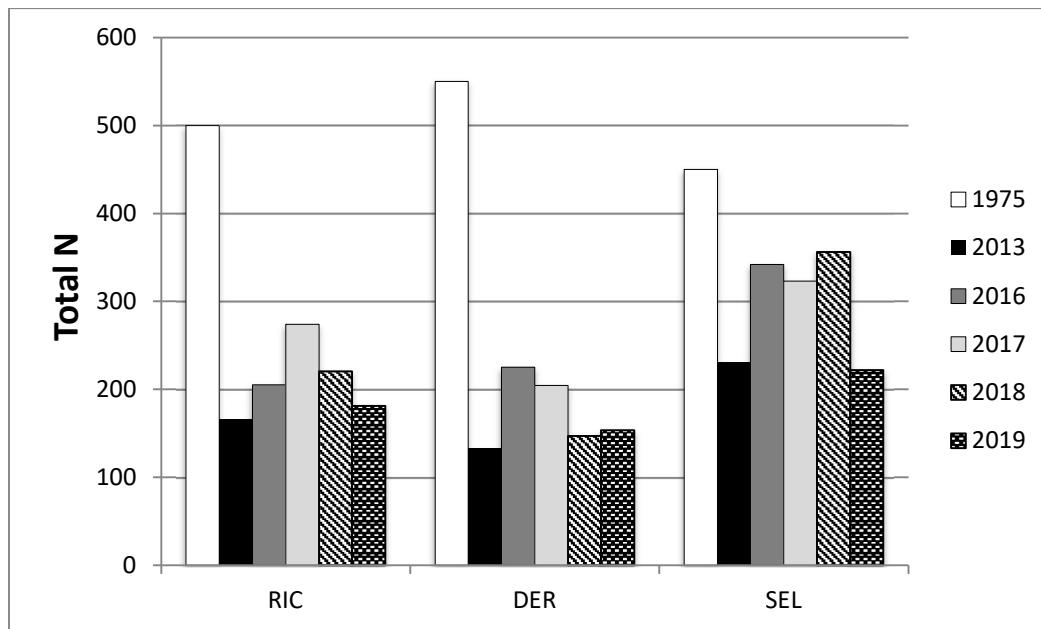

Figure 10. Median total N in three streams (RIC, DER, SEL) sampled in 1975, 2013, 2016, 2017, 2018, and 2019.

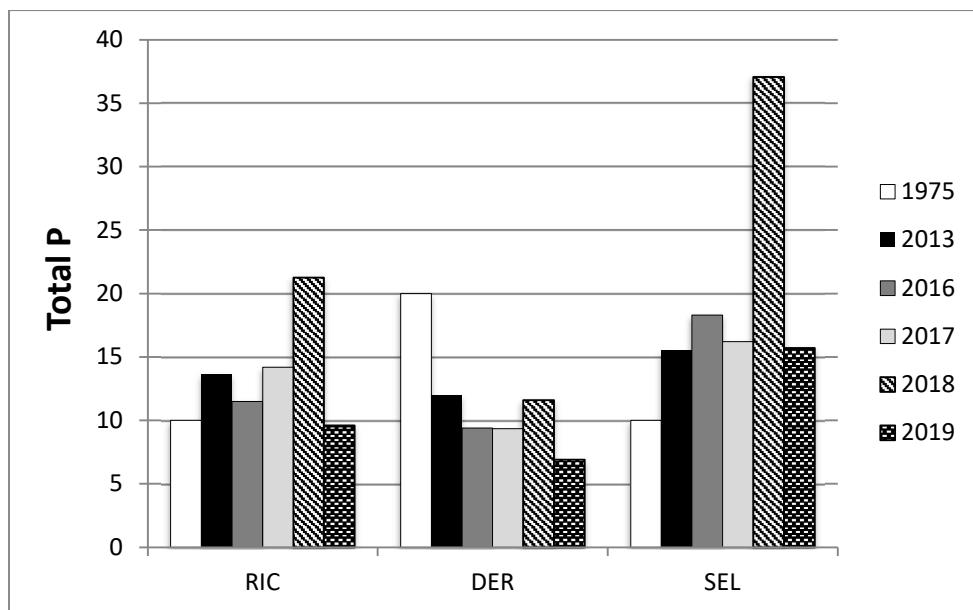

Figure 11. Median total P in three streams (RIC, DER, SEL) sampled in 1975, 2013, 2016, 2017, 2018, and 2019.

## Appendices 2019

Appendix A 2019. Sampling sites for Clearwater Basin water quality in 2019. Tier 1 streams were also sampled in 2013. Tier 1, tier 2 and tier 3 streams were sampled weekly throughout the runoff and included stage, turbidity, total nitrogen and total phosphorus. Tier 4 streams were sampled only for turbidity; and some were sampled only occasionally.

**Appendix B 2019.** Clearwater Valley Water Quality Data collected in 2019. Gage represents water depth either on a temporary staff installed at the sampling site or on a permanent gage. Negative values represent water levels that fell below the bottom of the gage and were measured from that point with a hand held ruler.
