

ACCELERATING LONGLEAF RESTORATION

Collaborative Forest Landscape
Restoration Program (CFLRP)

U.S.D.A. Forest Service
National Forests in Florida

H. Scott Ray, Carl Petrick, &
Susan Jeheber-Matthews

Background:

Department and Agency Priority

“Our shared vision begins with restoration. Restoration means managing forest lands first and foremost to protect our water resources, while making our forests more resilient to climate change.”

Tom Vilsack
USDA Secretary

“We will increase our focus on restoration of our forest and grassland ecosystems; restoration to increase resilience to ensure these systems are able to adapt to changes in climate.”

Tom Tidwell
Forest Service Chief

Background:

The Omnibus Act of 2009

- The Collaborative Forest Landscape Restoration Program was authorized in Title IV of the Omnibus Public Land Management Act of 2009 (Omnibus Act)
- A Federal Advisory Committee was established to evaluate and recommend proposals for funding. The panel met in July 2010 in an open meeting and recommended 10 projects for funding

Background: Purpose of CFLR

- From Title IV of the Omnibus Act: “The purpose of this title is to encourage the **collaborative, science-based ecosystem restoration of priority forest landscapes** through a process that
 - encourages **ecological, economic, and social sustainability**;
 - **leverages** local resources with national and private **resources**;
- Requirements include:
 - A 10 year **restoration strategy** that is complete or substantially complete **that identifies and prioritizes ecological restoration treatments** across a 50,000 acre or larger landscape on primarily National Forest System lands
 - Must be developed and implemented through a **collaborative process**
 - Incorporates **best available science and application tools**
 - demonstrates the degree to which--
 - Various ecological restoration techniques--
 - achieve ecological and watershed health objectives; and
 - affect wildfire activity and management costs; and
 - the use of forest restoration byproducts can offset treatment costs while benefitting local rural economies and improving forest health.”

Background: 2010 Projects

Why the Osceola NF?

WILDFIRE RISK

Why the Osceola NF?

The Osceola and adjacent lands have been plagued by wildfires

Why the Osceola NF?

Prior to CFLRP, over 31 million dollars were expended on wildfire suppression with a wildfire rehabilitation cost of 3.6 million dollars

Why The Osceola National Forest

The Bugaboo Fire in 2007 was the largest wildfire east of the Mississippi and closed Interstates 10 & 75 for days

Focus on Longleaf Pine

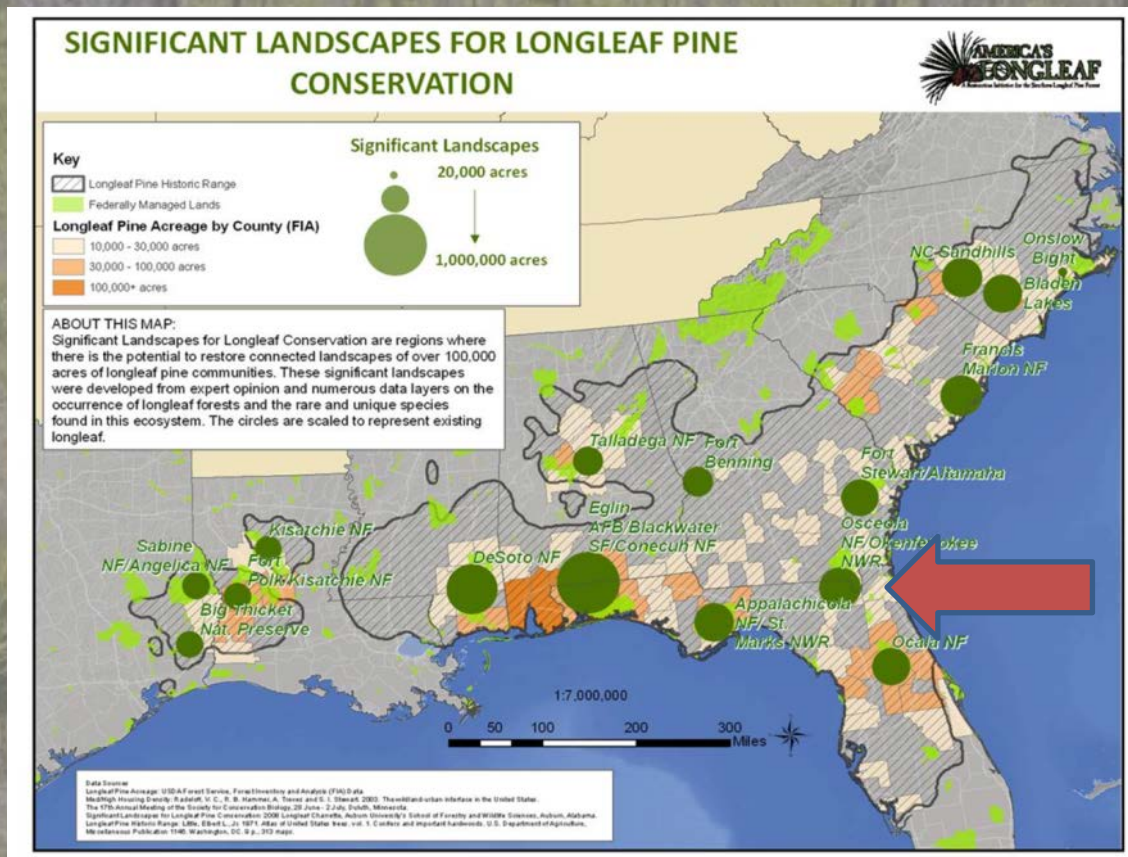

The Range-wide Conservation Plan For Longleaf Pine

- Developed by a Regional Working Group representing 22 organizations
- Supported by USDA Forest Service, Dept. of Defense, and U.S. Fish & Wildlife Service
- Released in March 2009

Why The Osceola National Forest

- The Forest is located within one of the significant longleaf pine conservation areas

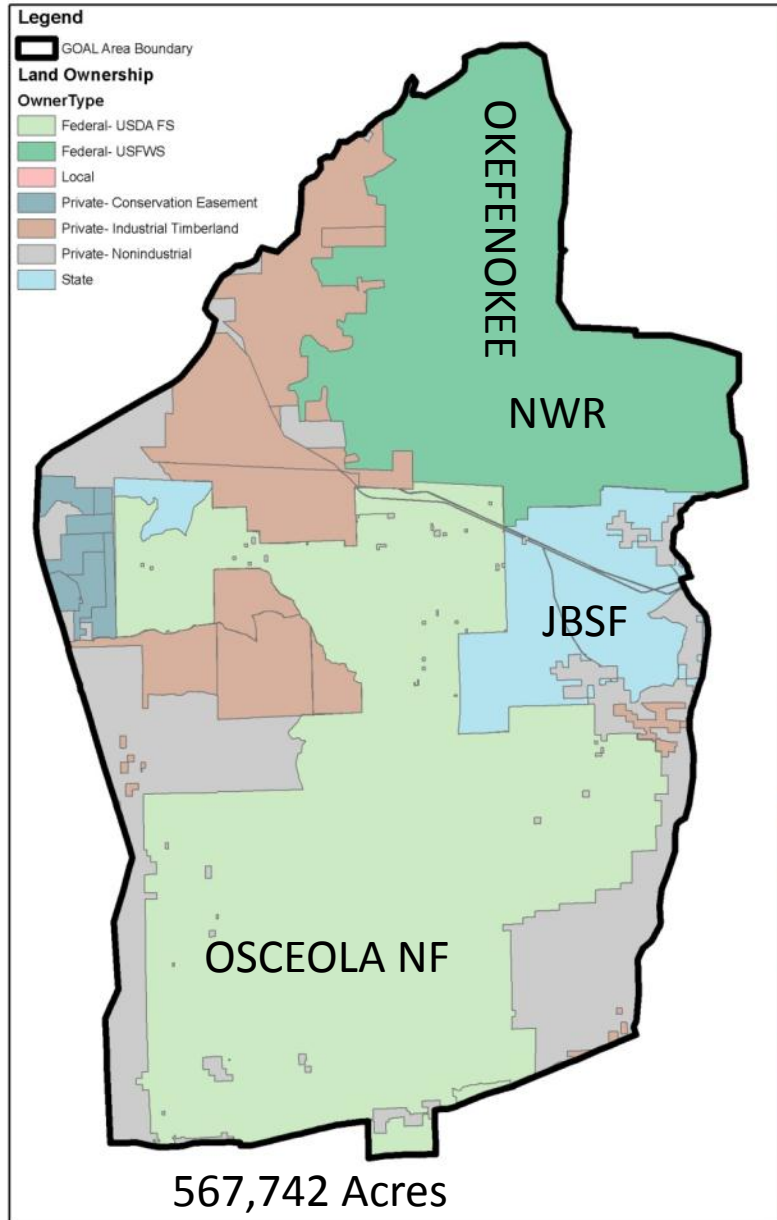

The Longleaf Ecosystem Connects Many Focus Areas

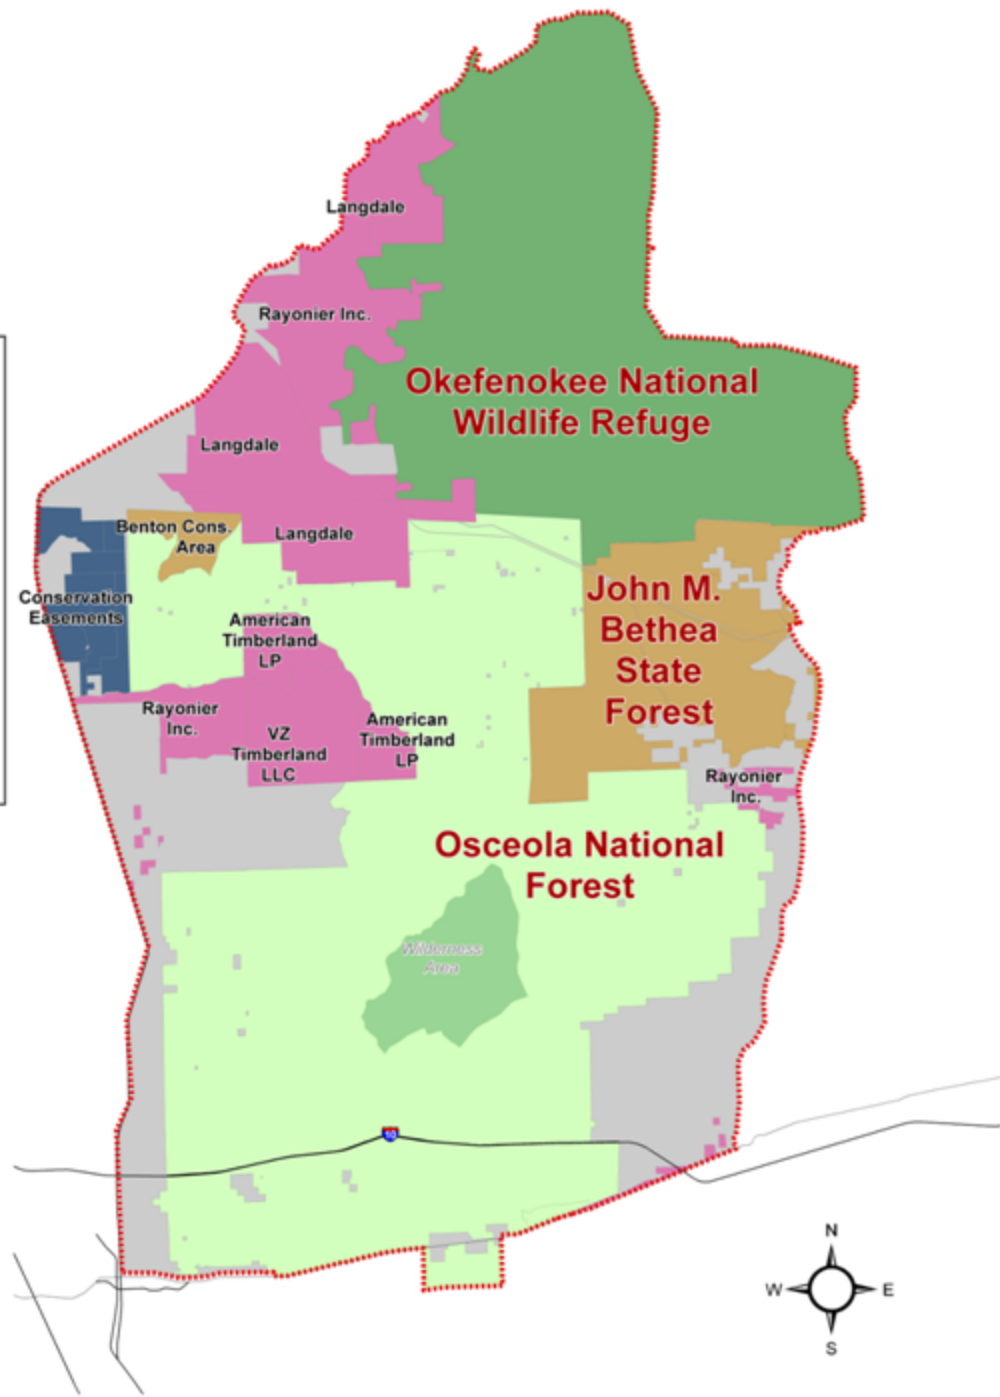

- T&E and Sensitive Species Habitat
- Climate Change mitigation
- Woody biomass developments
- Watershed health
- Economic viability

CFLR GOAL AREA LAND OWNERSHIP

CFLR GOAL Area Land Ownership

Land Owner	Acres	Percent
Federal	355,161	62.6
State	41,632	7.3
Private Cons. Easement	9,362	1.6
Private Ind. Timber	75,098	13.2
Private Nonindustrial	86,489	15.2
Total Acres	567,742	

Planning and Prioritization

How do we assess current conditions and prioritize treatments?

Planning and Prioritization

- The forest developed an Ecological Condition Model (ECM) to assess current conditions relative to desired conditions using prioritization models for fire, timber harvest, and mechanical fuel reduction

Purpose of ECM

Dramatically increase the health of forest ecosystems at a landscape scale by:

- Assessing current Ecological Condition vs. Desired Condition using ranked tiers
- Maximizing integration of program areas and dollars
- Prioritizing treatment areas and activities
- Balancing restoration with maintenance
- Increasing management efficiencies

Desired Condition of Pine Flatwoods

- Fire: Vegetation patterns determined by Rx burning and sustainable harvest
- Overstory: Mature pine forest with multiple age classes
- Midstory: No hardwood midstory
- Understory: Intact and healthy native pyrogenic groundcover
- Wildlife: Healthy populations of typical native species

Tier Classification

Tier 1

Excellent/ Maintenance Condition

Tier 2

Good/ Maintenance Condition

Tier 3

Fair/ Transitional Condition,
Some Restoration Required

Tier Classification

Tier 4 Poor Condition,
Restoration Required

Tier 5 Very Poor Condition,
Restoration Required

OSCEOLA ECM Inputs

A man wearing a yellow hard hat and a white polo shirt is standing in a forest, looking down at a handheld electronic device. The forest is dense with green vegetation and trees in the background.

- Basal Area
- Stand age
- Fire
 - Fire severity
 - Number of fires
 - Time since last fire

Timber Thinning

A background image of a dense forest with tall, thin trees and lush green undergrowth. The lighting is bright, suggesting a sunny day. In the top left corner, there is a small icon of a speech bubble with three lines inside, indicating a list or menu.

Benefits

1. ECM process results in interdisciplinary synergy
2. Maximizes analytical powers of GIS for land management planning
3. Tracks changes in ecosystem condition
4. Provides an essential mid-level planning tool
5. Allows more open and transparent management decisions
6. Facilitates collaboration with public/private agencies and stakeholders
7. Facilitates development of DFCs and Objectives during Forest Plan revision
8. Demonstrates management progress (e.g., annual monitoring report)
9. Displays possible future landscape conditions resulting from different management scenarios

Implementation Activities

Implementation Activities

- Removal of off-site pine and restore to longleaf
- Understory restoration via palmetto reduction
- Release and weeding of young longleaf
- Fuel Reduction
 - Thinning
 - Mastication
 - Rx Fire

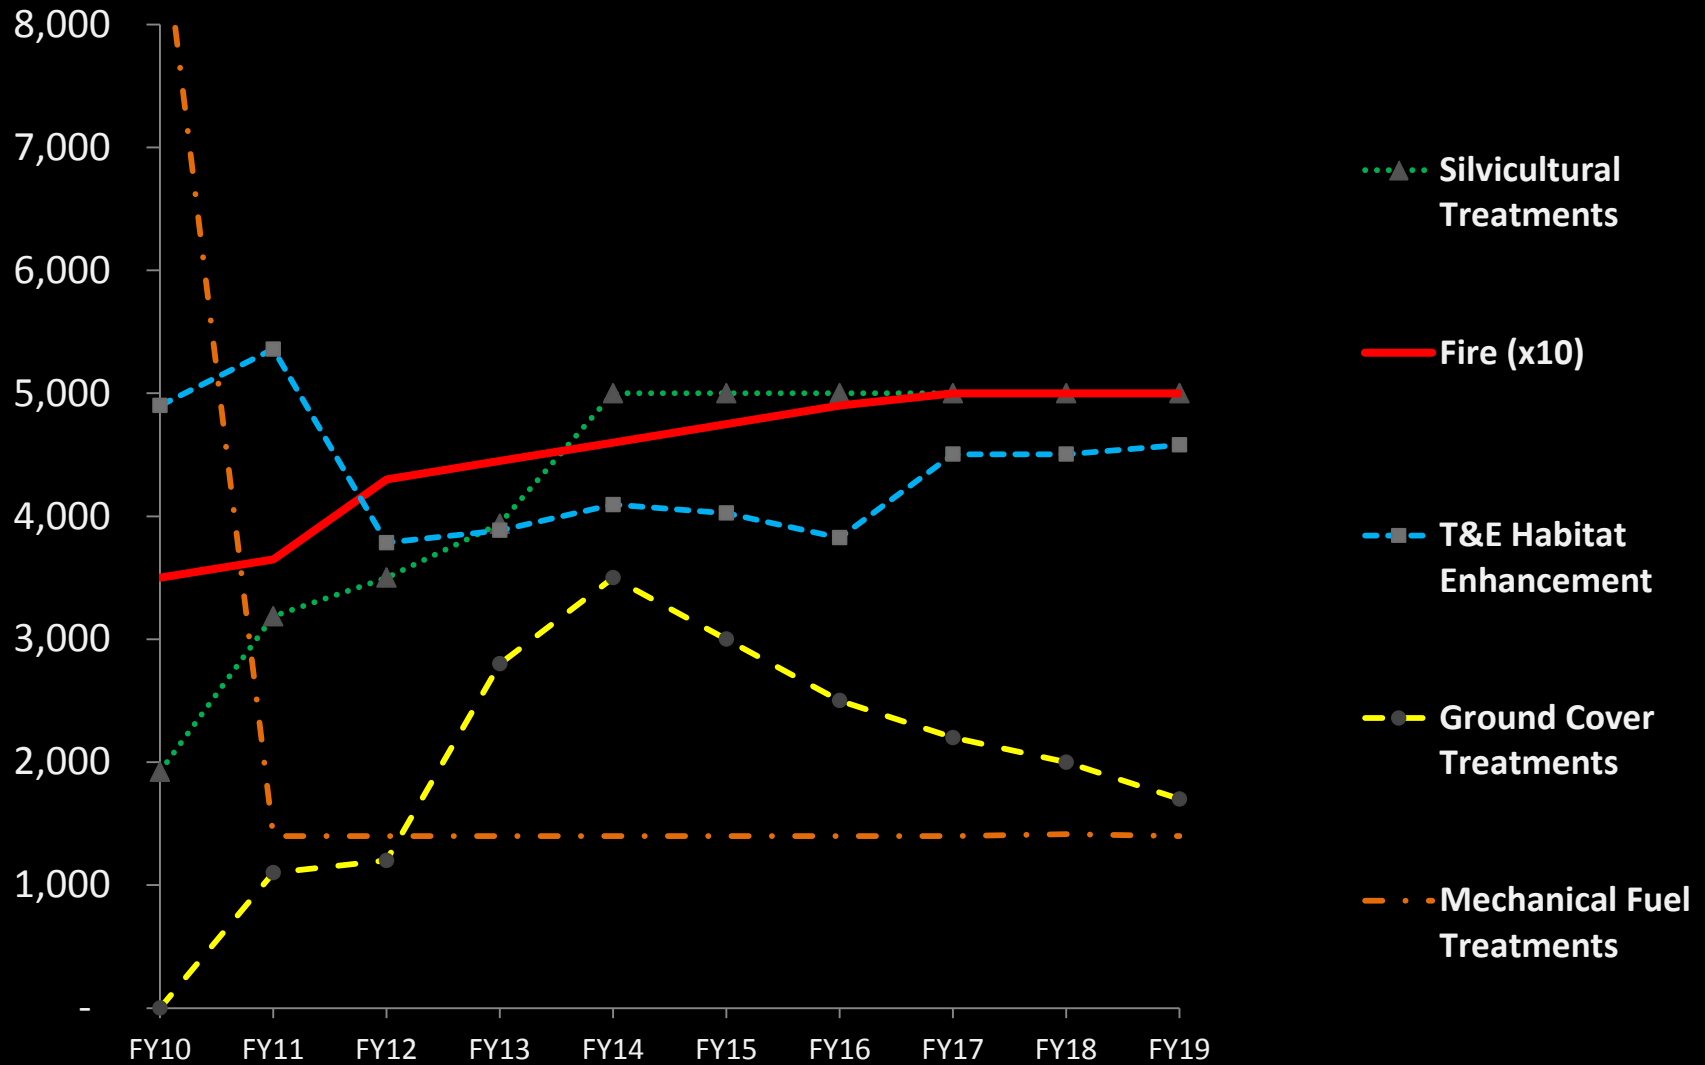

CFLRP Implementation

1. Double the annual prescribed fire acreage to 50,000 acres
2. Mechanically reduce fuel loads on 10,000 acres
3. Increase timber harvest from thinning less than 2,000 acres a year to 5,000 acres a year for the next 10 years
4. Restore ground cover by light roller chopping 21,000 acres followed by application of prescribed fire
5. Restore hydrology by correcting known problems on 309 miles of roads and 90 miles of old fire lines
6. Assistance for state and private land cooperators to conduct restoration treatments

How are we sequencing work?

Forecasted CFLRP Accomplishments in Acres FY10 – FY19

A photograph of a pine forest. The trees are tall and thin, with dark brown trunks and green needles. The ground is covered in grass and low-lying vegetation. The sky is visible through the canopy.

Wildlife Habitat Enhancement

A photograph of a pine forest. The image shows numerous tall, straight, dark brown tree trunks standing in a row, receding into the distance. The ground is covered with a dense layer of green, needle-like plants, likely young pine trees or ground cover. The lighting is bright, suggesting a sunny day. The text "Measuring Success" is overlaid in the center of the image in a white, sans-serif font.

Measuring Success

A photograph of a pine forest with a person in a yellow hat visible in the distance. The text is overlaid on the image.

CFLR Program Accomplishments on the Osceola National Forest (2010-2012)

- 100,964 acres of fuels reduction (29,183 WUI)
- 56,006 acres of wildlife habitat improvement
- 3,382 acres of groundcover restoration
- 6,741 acres converted from slash pine to longleaf
- 79,704 cubic feet of timber sold
- 8,852 acres of forest lands treated through timber sales

Acres Treated

Fiscal Year	Acres Treated
2010	67,527
2011	45,858
2012	62,354

Collaboration Fire Planning

Providing Solutions For...

Fire Managers

STARFire addresses critical elements of designing and implementing a fire program. It supports strategic and short-term fire management decisions and displays decision outcomes in a ways that are easily understood and communicated. STARFire can be tailored to produce spatial images of program outcomes that focus on specific questions (designing a fuels treatment plan) or on broader fire management issues (analyzing fire management plan alternatives).

Fire Planners

Fire planners can employ local goals and objectives through STARFire's valuation process to assess the effectiveness of current management strategies, or expand the scope to view and assess planning alternatives and gauge how each alternative progresses toward a desired fire management condition. Planning results may be interpreted visually and are quantified with critical metrics.

STARFire is an advanced and powerful spatial fire management planning and analysis system.

It sets a new standard in visual and analytic support for fire management planning, decisions and communication. STARFire has been carefully constructed to generate a full suite of baseline outputs from fire behavior data and valuation information founded on local knowledge and experience.

The robust architecture of STARFire supports fire planners and managers across multiple tiers of the decision making and planning process. STARFire supports preseason planning, tactical (project level) implementation and strategic (program level) planning.

STARFire can assist Fire Managers and Planners by addressing a common set of questions:

- What are the expected benefits and risks of an unplanned fire on the landscape?
- What locations are good candidates for locating fuel treatments to meet hazard and ecosystem objectives?
- How do planned and unplanned ignitions affect the condition of the landscape, especially the departure from a desirable fire management condition?
- How can I quantify cumulative effects (across time and space) to fulfill environmental compliance requirements?
- Where is smoke likely to be an important consideration?
- If I have an ignition, which portions of the fire perimeter are likely to require protection and which are likely to produce ecosystem benefits? What are some likely risks and benefits of an on-going event as its perimeter expands?

<http://warnernr.colostate.edu/starfire-home/>

From a common set of inputs the full analysis suite can be generated

Web-based Access

STARFire is built on a service-oriented architecture that allows the results of the analysis to be published as map services. Each analysis is accompanied by a high quality intuitive display to help managers and planners communicate planning and management strategies. These displays can be accessed through geospatial viewers such as ArcMap, the STARFire Viewer and Google Earth.

Landscape Analysis

The landscape analysis is used to compare planning alternatives. A quantitative picture (a snapshot) of the landscape relative to a desired fire management condition is taken for any planning or management scenario. By comparing snapshots from different alternatives, planners can document and display the relative advantages. Snapshots can be compared to assess the efficacy of alternative planning strategies. The landscape analysis can compare fuel treatments, suppression alternatives, or a combination of fire management strategies. It can also address how the desired fire management condition changes with time.

Unplanned Ignition Analysis

The unplanned ignition analysis shows where fire can benefit the ecosystem and where fire can be risky to property and other highly valued resources. The entire landscape is scanned to estimate potential benefits and risks from any ignition location. Each cell is assigned a color showing the benefits and risks of a simulated fire footprint. Risky ignition cells are shown in red and ignition cells that can benefit the ecosystem are shown in green. The darker colors indicate more intense impacts.

Fuel Treatment Analysis

The fuel treatment analysis scans the entire planning unit to suggest optimal locations for fuel treatments. STARFire considers the benefits of ecosystem improvement and hazard fuel reduction. Using alternative planning scenarios to increase the number of acres treated, a prioritized view of fuel treatment locations can be generated. The locations suggested by STARFire provide a landscape perspective that can compliment tactical implementation efforts.

Smoke Analysis

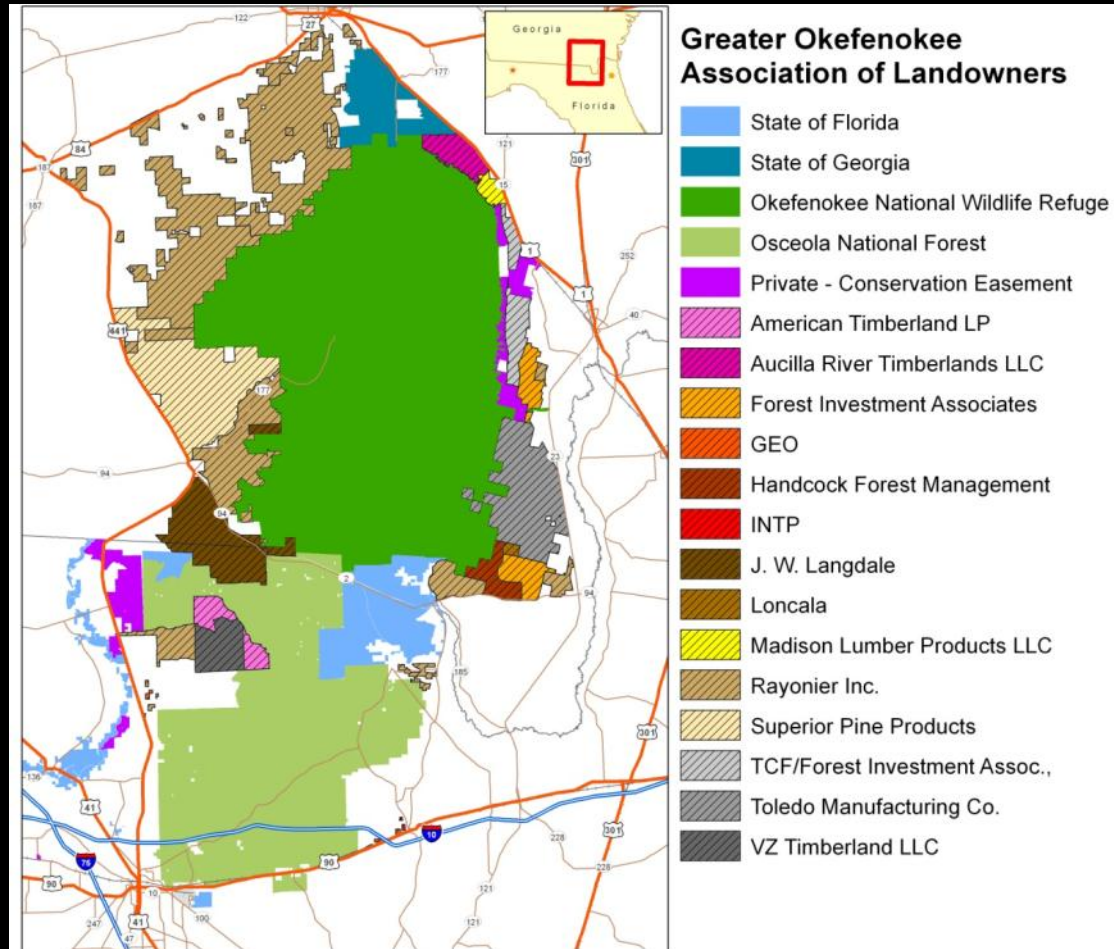

STARFire generates a smoke impact map that combines information on the potential of fuels to produce emissions and the estimated impact of emissions. The smoke analysis complements the unplanned ignition analysis by giving fire managers and planners quick access to potential smoke impacts for any unplanned ignition. The smoke analysis also provides a strategic level view of areas on the landscape that are likely to generate important emission concerns.
