

## **Refractometer Calibrations**

The salt content measured by field refractometers helps to assure the base manager the correct mix ratios are being met. The tolerance for these refractometer readings are listed in the Mix Factor table available on the LAQA page of the Wildland Fire Chemicals website. Our program recommends calibrating these instruments annually to assure they are providing accurate readings each fire season. Below is contact information for having this service completed. There are likely other alternatives available, so any calibration laboratory that is capable of these annual calibrations would be suitable for use.

We recommend contacting the lab prior to shipping any equipment.
